#ACCELERATE: MANIFESTO FOR AN ACCELERATIONIST POLITICS

In general, just like most manifestos I read, I can only really understand the language of about half the text. This might be from the fact that most people who write these manifestos have in-depth and passionate knowledge about the topic and thus can write in an abstract manner, but it really does not help when the reader has never encountered that topic perspective. For #Accelerate, from what I can gather, the topic is about the growing number of problems that are increasing while the government and the human reaction are decreasing. I've actually felt like I read something similar and they attributed this problem to the global connectivity, the enormous human population, and the scope of the problem, like how a reef of fish against a dolphin can usually get away with only losing a few of the reef fish because the population is small and they scatter as needed, while a colony of krill will have the majority of its members consumed because they are too interconnected with each other and the population is too large to perform quick maneuvers. It also doesn't help that if we were to compare a country to a colony of krill it would be like a game of following the leader where the majority are forced to follow the actions of a few even when they become detrimental as the majority lack both power and a brain. The comfortable conditions we live in today also lead to the loss of ingenuity towards critical technology. Instead of creating automation to improve life, such as bacteria analysis or cell/quality degradation checkers in refrigerators, people are making talking refrigerators. Essentially rather than concentrate on technology to entertain ourselves, there should be a concentration on life-saving and critical technology which can also be considered just as economically productive as many households would love to make sure they aren't about to poison their family and improve health standards as suppliers can no longer skimp on quality.
